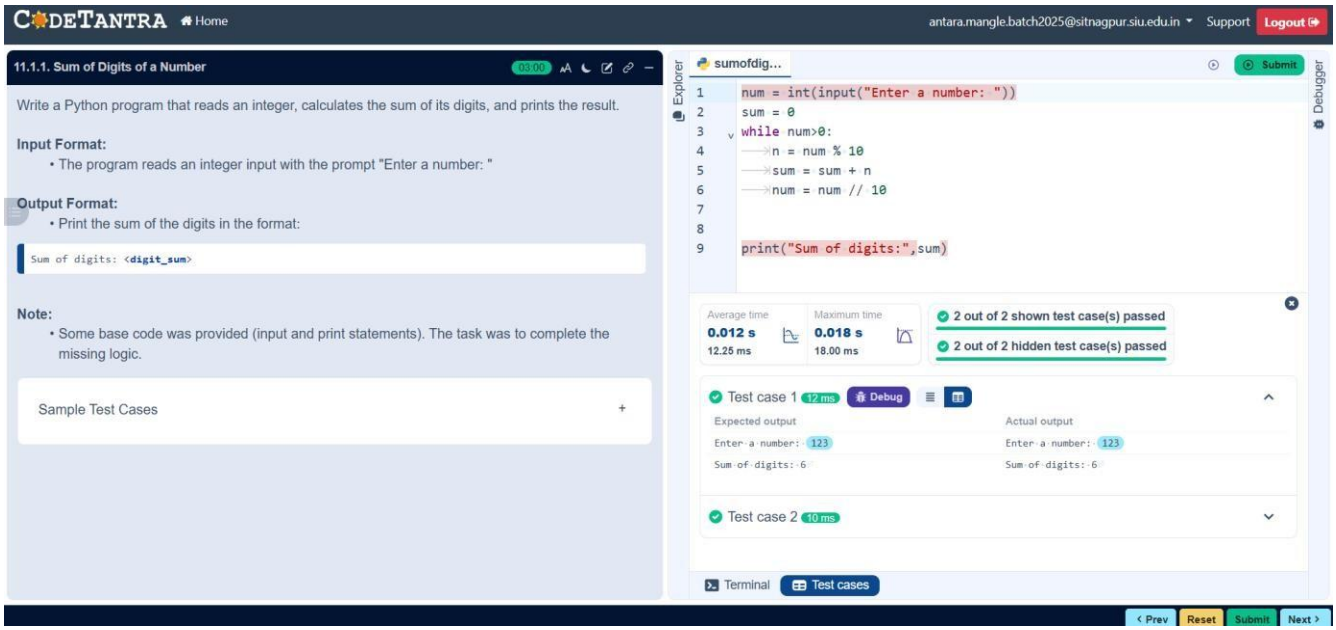
11.1



Algorithm

Step 1 : Start

Step 2 : Input an integer and store it in num

Step 3 : Set sum to 0

Step 4 : Repeat steps 5 through 7 while num is greater than 0

Step 5 : Find the last digit using the modulo operator: digit = num % 10

Step 6 : Add the digit to the current sum

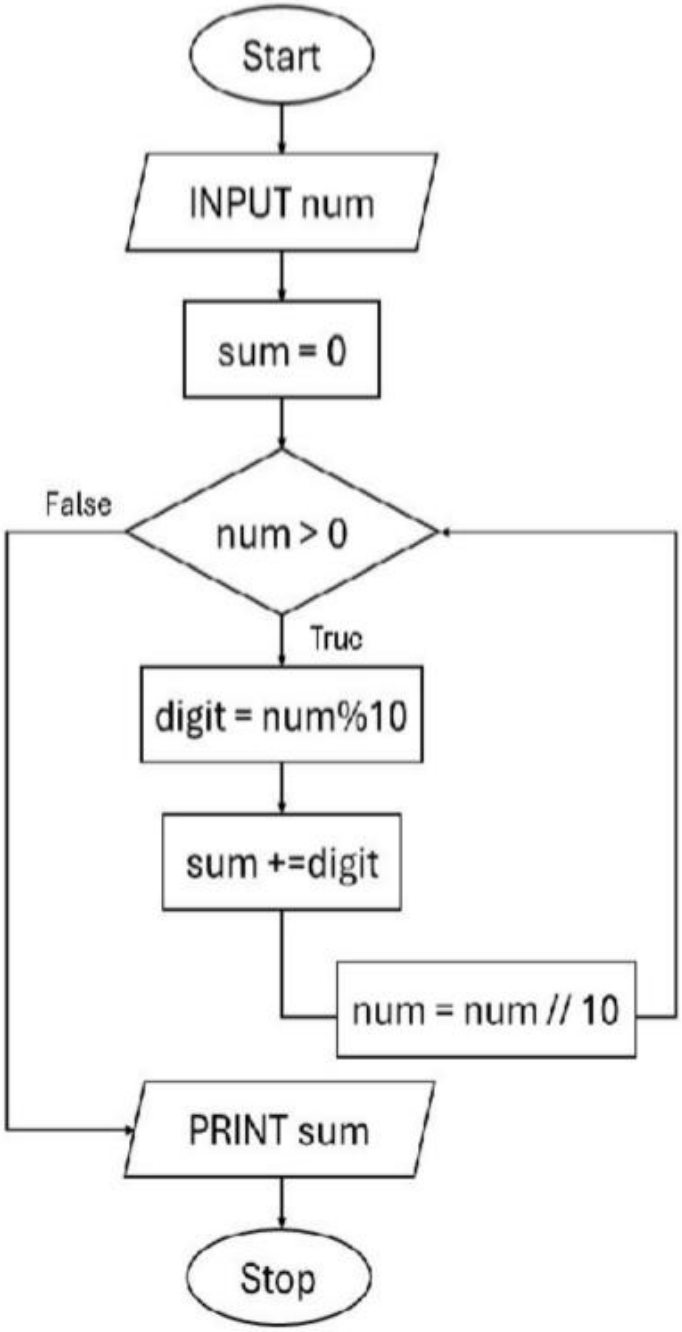
Step 7 : Remove the last digit using integer division: num = num // 10

Step 8 : Go back to Step 4

Step 9 : Once num becomes 0, exit the loop

Step 10 : Print the final value of sum

Step 11 : Stop



Start
INPUT num
sum = 0
False
num > 0
True
digit = num%10
sum +=digit
num = num // 10
PRINT sum
Stop
